Education

CUNY Hunter College

B.A. Computer Science

New York, NY

May 2026

Work Experience

Secco Squared

June 2026 – Present

Full Stack Developer | TypeScript, React, PostgreSQL, Python

New York, NY

- Cut 20 minutes of manual entry per offer and surfaced 28,560 missed offers by building OfferBridge, a Next.js/TypeScript tool that pulls offers from partner REST APIs and logs imports in PostgreSQL
- Let staff get live offer and sync answers in Slack by building an AI agent on OpenAI tool calling that runs multi-step lookups, checks each user's permissions, and asks before making changes
- Stopped live offers from overspending partner budgets, a revenue leak raised by the business team, with a scheduled Vercel cron job that pauses capped offers via the Everflow API and alerts Slack
- Kept sales leads from being lost when partner systems went down by building a Next.js REST API on Supabase (PostgreSQL) that saves each lead first, then delivers it with automatic retries
- Saved \$1,300+ per month by rebuilding a video sales funnel as responsive HTML/CSS pages in Next.js and React, with video streaming and ad-conversion tracking
- Shipped 175+ merged pull requests across 11 company codebases by setting up GitHub Actions CI/CD pipelines, writing tests first (TDD), and using AI agents (Claude Code, Cursor) to write and review code

Unadat

June 2025 – August 2025

Software Engineer Intern

New York, NY

- Shipped service extractions across several production releases by decomposing a PHP/JavaScript monolith alongside senior engineers and testing changes before code review
- Sped up slow REST endpoints by batching repeated MySQL queries and validating inputs in the PHP backend
- Made UI fixes land once instead of in every copy by consolidating duplicate forms and modals into shared React components, delivered in Agile Scrum sprints

Personal Projects

Agentflow

- Made AI-written code changes safe to approve by building Agentflow, a Python CLI that isolates each change in its own Git worktree, validates AI output against schemas, and requires human sign-off
- Let developers swap between Claude Code, Codex, and Cursor without changing their workflow by writing Python adapters that give each AI agent a builder, reviewer, or tester role

Kyarafit

- Let cosplayers plan outfits and convention packing lists offline by building web and mobile apps in Next.js, React Native (Expo), and Tailwind CSS that sync local SQLite data to Convex
- Protected users' offline data from regressions with Vitest unit tests that run in GitHub Actions on every pull request and Playwright browser tests for offline editing and export/import

ForgeArena

- Motivated users to exercise with workout logs, quests, and leaderboards by building a React app on Node.js/Express APIs and Firestore
- Blocked broken releases by gating every Vercel deploy in GitHub Actions on Jest tests, ESLint, and a production build

Technical Skills

Languages: TypeScript, JavaScript, Python, SQL, HTML/CSS, PHP, Bash

Frameworks: React, Next.js, React Native, Node.js, Express, Fastify, Tailwind CSS, REST APIs

Data & DevOps: PostgreSQL, MySQL, Supabase, Convex, SQLite, Firestore, Git, GitHub Actions CI/CD, Docker, Vercel

Testing & AI: Vitest, Jest, Playwright, TDD, Agile Scrum, OpenAI API, MCP, Claude Code, Codex, Cursor
