SUMMARY

Software Engineering student graduating this semester with experience building production-ready full-stack systems. Skilled in API design, authentication, data modeling, and CI/CD across Go and JavaScript stacks, with hands-on experience modernizing legacy platforms.

WORK EXPERIENCE

Software Engineer Intern

June 2025 – August 2025

Unadat

New York, NY

- Cut feature delivery time by 25% by re-architecting a legacy JS/PHP monolith into modular components across B2C and B2B flows
- Grew active usage across B2C and B2B customers by shipping 6+ production features aligned with real user workflows
- Improved platform-wide UI consistency by converting core elements into reusable modals and standardizing interaction patterns
- Accelerated API response times by 15% by refactoring 10+ RESTful endpoints with input validation and query optimization

PROJECTS

B2B Task Management Platform | *PHP, JavaScript, MySQL, GCP*

June 2025 – August 2025

- Supported 100+ concurrent users by building a mobile-optimized task system with escalation logic and multi-round negotiation
- Shortened task turnaround time by 30% by implementing role-based access controls and delegated approval routing
- Lowered maintenance effort by 40% by unifying B2C and B2B flows into a single extensible codebase

KyaraFit | *Go, React.js, React Native, Next.js, PostgreSQL, Docker, FastAPI*

August 2025 – Present

- Enabled cross-platform access by architecting a system with a Go (Fiber) API, FastAPI image service, and React Native clients
- Eliminated cross-platform bugs by centralizing business logic in shared backend services across web and mobile
- Secured user sessions across all services by implementing JWT authentication with middleware-protected endpoints

ForgeArena | *React.js, TypeScript, Node.js, Express.js, CI/CD*

August 2025 – December 2025

- Built a gamified fitness platform with 5-layer architecture supporting avatar progression, quests, and raid boss mechanics
- Decreased user planning time by 40% by integrating Gemini API for ML-powered workout recommendations
- Achieved 95% test coverage and automated Heroku deployments by implementing CI/CD with Jenkins and GitHub Actions

RandCompile | *C, Python, GCC, UNIX*

February 2025 – May 2025

- Strengthened kernel forensic resistance under malicious hypervisor threat models via compile-time ABI randomization and struct obfuscation in a GCC plugin
- Automated pointer encryption and modular ABI handling while maintaining compatibility with existing kernel modules
- Maintained sub-5% performance overhead by designing hardened data layouts with minimal runtime cost

EDUCATION

CUNY Hunter College

B.A. in Computer Science

New York, NY

August 2022 – Present

SKILLS

Languages: JavaScript, TypeScript, Go, Python, SQL, C/C++, PHP

Frameworks: React.js, Node.js, Express.js, Next.js, Fiber, FastAPI

Databases: PostgreSQL, MySQL

Cloud & Tools: Docker, Git, CI/CD (GitHub Actions, Jenkins), GCP
