Education

CUNY Hunter College

B.A. Computer Science

New York, NY

May 2026

Work Experience

Secco Squared

June 2026 – Present

Web Developer

New York, NY

- Cut manual entry by 20 minutes per offer and surfaced 28,560 missed offers by building OfferBridge in Next.js and TypeScript, integrating 23 partner APIs with PostgreSQL-backed review and import tracking
- Enabled live offer/sync queries and guide-grounded workflow navigation by integrating the OpenAI API with 9 permission-scoped tools, bounded call rounds, and confirmation-gated writes
- Made The Weekly Investor (TWI) financial research replayable across 10 snapshot artifact types by building a copilot with read-only SQL data collection, hash-verified Convex snapshots, cited evidence, human-approved mandates, and disabled trade execution
- Saved \$1,300+ per month by rebuilding a video sales funnel with reusable Next.js components and A/B-testing page variants against live traffic

Unadat

June 2025 – August 2025

Software Engineer Intern

New York, NY

- Shipped service extractions across several production releases by decomposing a PHP/JavaScript monolith alongside senior engineers and testing changes before code review
- Reduced repeated queries and duplicate UI implementations across REST endpoints, forms, and modals by batching database reads, validating inputs, and consolidating shared React components

Personal Projects

Agentflow

- Made AI-generated changes auditable across build, test, and review by creating Agentflow, a Python workflow CLI for developers, with schema-validated outputs, isolated worktrees, replayable events, and human approval tied to verified commits
- Guarded reviewer prompt/model changes against known-good and known-bad fixtures by building a unittest evaluation harness that rejects malformed reviews and blocks approval when blocker findings remain

Kyarafit

- Enabled offline use of Kyarafit, a cosplay wardrobe and convention packing planner, across web and mobile by sharing TypeScript models between Next.js/React Native clients and synchronizing SQLite edits through idempotent Convex mutations

OutfAI

- Enabled explainable outfit choices from users' own clothes by building OutfAI, a wardrobe planner with mood/weather/style scoring in Convex and typed recommendation queries for its Next.js UI
- Protected outfit ranking and sign-in flows against regressions by writing Vitest unit tests and Playwright browser tests for scoring, public routes, and authentication redirects
- Made OutfAI's web development environment repeatable across host machines by packaging its Next.js server in Docker Compose with a pinned Node.js runtime and hot reload

ForgeArena

- Enabled workout logging, quests, and leaderboards in ForgeArena, a fitness app for building exercise motivation, by connecting a React UI to layered Node.js/Express APIs and Firestore
- Gated ForgeArena's Vercel deployments on tests, lint, and successful builds by configuring GitHub Actions with Jest suites and a production build check

Technical Skills

Languages & Data: TypeScript, Python, JavaScript, SQL, PostgreSQL, Convex

Full-Stack & Delivery: React, Next.js, Node.js, OpenAI API, Docker, GitHub Actions, Vitest, Playwright
