SUMMARY

Software Engineering student graduating this semester with experience building production-ready full-stack systems. Skilled in API design, authentication, data modeling, and CI/CD across Go and JavaScript stacks, with hands-on experience modernizing legacy platforms.

WORK EXPERIENCE

Software Engineer Intern, Unadat
New York, NY

June 2025 – August 2025

- Re-architected a legacy JS/PHP monolith into modular components across B2C and B2B flows, cutting feature delivery time by 25%
- Shipped 6+ production features aligned with real user workflows across B2C and B2B platforms
- Converted core UI elements into reusable modals and standardized interaction patterns across the platform
- Refactored 10+ RESTful endpoints with input validation and query optimization, accelerating API response times by 15%

PROJECTS

B2B Task Management Platform | *PHP, JavaScript, MySQL, GCP*

June 2025 – August 2025

- Built a mobile-optimized task system with escalation logic and multi-round negotiation, supporting 100+ concurrent users
- Implemented role-based access controls and delegated approval routing, shortening task turnaround time by 30%
- Unified B2C and B2B flows into a single extensible codebase, reducing maintenance effort by 40%

KyaraFit | *Go, React.js, React Native, Next.js, PostgreSQL, Docker, FastAPI*

August 2025 – Present

- Architected a cross-platform system with a Go (Fiber) API, FastAPI image service, and React Native clients
- Centralized business logic in shared backend services across web and mobile, eliminating cross-platform inconsistencies
- Implemented JWT authentication with middleware-protected endpoints across all services

ForgeArena | *React.js, TypeScript, Node.js, Express.js, CI/CD*

August 2025 – December 2025

- Built a gamified fitness platform with 5-layer architecture supporting avatar progression, quests, and raid boss mechanics
- Integrated Gemini API for ML-powered workout recommendations, reducing user planning time by 40%
- Implemented CI/CD with Jenkins and GitHub Actions, achieving 95% test coverage and automated Heroku deployments

RandCompile | *C, Python, GCC, UNIX*

February 2025 – May 2025

- Strengthened kernel forensic resistance under malicious hypervisor threat models via compile-time ABI randomization and struct obfuscation in a GCC plugin
- Automated pointer encryption and modular ABI handling while maintaining compatibility with existing kernel modules
- Maintained sub-5% performance overhead by designing hardened data layouts with minimal runtime cost

EDUCATION

CUNY Hunter College, Bachelor of Arts in Computer Science
May 2026

New York, NY

SKILLS

Languages: JavaScript, TypeScript, Go, Python, SQL, C/C++, PHP

Frameworks: React.js, Node.js, Express.js, Next.js, Fiber, FastAPI

Databases: PostgreSQL, MySQL

Cloud & Tools: Docker, Git, CI/CD (GitHub Actions, Jenkins), GCP
