SUMMARY

Software Engineering student graduating this semester with experience building and deploying production-ready backend and full-stack systems. Experienced in API design, authentication, relational data modeling, and CI/CD pipelines across Go and JavaScript-based stacks. Strong foundation in systems programming and security, with hands-on experience modernizing legacy platforms and shipping scalable applications.

WORK EXPERIENCE

Software Engineer Intern

June 2025 – August 2025

Unadat

New York, NY

- Reduced feature delivery time by 25% by decomposing a legacy JavaScript/PHP monolith into modular, reusable components used across B2C and B2B flows
- Increased active usage across B2C and B2B customers by shipping 6+ production features aligned with real user workflows
- Saved frontend engineering time by 20% by refactoring shared UI logic into reusable components and standardizing interaction patterns
- Improved API response latency by 15% by refactoring and adding automated tests to 10+ RESTful API endpoints

PROJECTS

B2B Task Management Platform | *PHP, JavaScript, MySQL, GCP*

June 2025 – August 2025

- Supported over 100 concurrent users by building a mobile-optimized task management system with escalation logic and multi-round negotiation workflows
- Reduced task turnaround time by 30% by enabling delegated approvals and role-based task routing, removing manual handoffs and approval delays
- Reduced development and maintenance effort by 40% by unifying B2C and B2B logic into a single extensible codebase

KyaraFit | *Go, React.js, React Native, Next.js, PostgreSQL, Docker, FastAPI*

August 2025 – Present

- Enabled cross-platform mobile and web access by architecting a distributed system with a Go (Fiber) REST API, Python FastAPI image service, and React.js / React Native clients
- Reduced cross-platform bugs by centralizing business logic in backend services shared by both web and mobile clients
- Reduced security risk and support overhead by implementing JWT-based authentication and middleware-protected RESTful APIs across all services
- Improved CI reliability by containerizing services with Docker to standardize local development and automated test environments

ForgeArena | *React.js, TypeScript, Node.js, Express.js, CI/CD*

August 2025 – December 2025

- Reduced feature delivery time by 20% by unblocking teammates through stable backend APIs and faster CI feedback loops
- Reduced user workout planning time by 40% by integrating Gemini-powered workout recommendations into backend REST APIs

RandCompile | *C, Python, GCC, UNIX*

February 2025 – May 2025

- Increased kernel resistance to forensic analysis by implementing compile-time ABI randomization and data structure obfuscation in a custom GCC plugin
- Maintained system performance within 5% overhead while adding pointer encryption and hardened kernel data layouts

EDUCATION

CUNY Hunter College

B.A. in Computer Science

New York, NY

August 2022 – Present

SKILLS

Languages: JavaScript, TypeScript, Go, Python, SQL, C/C++, PHP

Frameworks: React.js, Node.js, Express.js, Next.js, Fiber, FastAPI

Databases: PostgreSQL, MySQL

Cloud & Tools: Docker, Git, CI/CD (GitHub Actions, Jenkins), GCP
